

COMPONENTS FOR HIGH PERFORMANCE

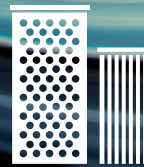

Sophisticated equipment will only perform at its best when all the right components are in the right place. In a compressor or vacuum pump, that means using Atlas Copco genuine parts when performing service.

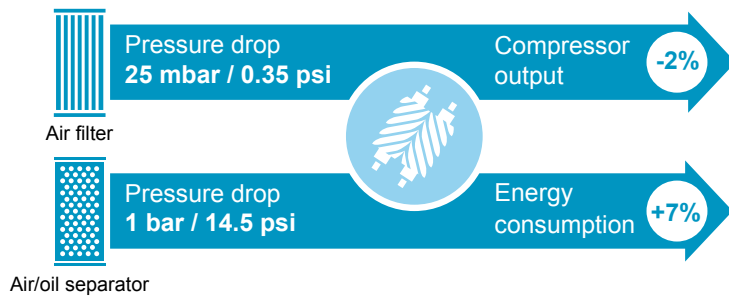

Atlas Copco

Making The System Work

When a customer buys an Atlas Copco compressor or vacuum pump, it corresponds with very specific expectations in terms of output, energy efficiency, air quality etc.

To uphold these specifications after service, it is vital to use the parts that were designed and produced for the original equipment. Only genuine parts fully uphold the integrity of the equipment and guarantee its performance.

ASK YOURSELF...

What is the potential impact of non-genuine parts?

Alternative parts are often designed to accommodate multiple types of machines, by making concessions on their specifications. However, a one-size-fits-all component may cause pressure drops, increased energy consumption, or breakdowns. Moreover, a non-genuine part may damage other components, further impacting your production process. A generic lubricant for instance, might corrode the sealing and cause leakages, decreased compressor output, and higher power consumption.

How important is risk management for my organization?

Since non-genuine parts are not tailor-made for Atlas Copco equipment, they may compromise the reliability of your compressors or vacuum pumps, increasing the risk of failure, loss of production and all the associated costs. While manufacturers of generic parts will only take responsibility for their specific products, Atlas Copco genuine parts come with warranties that cover the whole machine.

Can I simplify the purchase process?

Sourcing alternative parts means you'll have to negotiate prices, lead times and delivery with multiple vendors. As the Original Equipment Manufacturer, Atlas Copco offers the complete range of genuine parts needed to service your equipment. One single point of contact means less administration and more time to focus on your core business.

Designed To Perform. Built To Last.

The design and manufacturing of our genuine parts are subjected to a rigorous quality assurance system, ensuring each single part meets all the specifications. The quality of the genuine parts directly translates into high uptime and maximum efficiency of the equipment and quality air supply.

"We don't want to put our production at risk with generic parts. Our compressor needs to keep running smoothly and efficiently."

Go For Genuine

Keep getting the most out of your valuable equipment. Choose Genuine Parts only, because nothing else will give you the same return.
