

Tightening analysis according to OEM guideline

Secure your competitive advantage right
now with Atlas Copco

You are an OEM or a supplier of fastened components used in the automotive industry?
An analysis of a bolted joint according to an OEM guideline is required?
This tightening analysis provides you with information about the characteristics of the components in the bolted joint, taking into account all relevant measured parameters.

The scope of services consists of the **realization** and **evaluation of your bolted joint** according to the specifications in an OEM guideline. You will receive an analysis report on the measurements, which contains the torque curves and measured data according to the OEM guideline. In addition, we will provide you with general **information and possible solutions to any anomalies** that may have occurred during the analyses.

Target:

The objective is to prove, whether the tightening application meets the quality requirements of the OEM guideline.
