

## Safety notice

## Restarting your plant after shutdown

Dear,

We wish you and your family are safe and doing fine in these tough times. Due to lockdown and other measures taken in the fight against COVID-19 virus are restricting us as a society and have also led to plant shutdowns as well as disruptions in production. Following the pandemic, restarting the plants in a controlled manner will be necessary.

Atlas Copco equipment is essential in many manufacturing applications, and we will contribute to safeguarding your production process.

A long shutdown period can cause some unexpected event during the restart. Here are some recommendations to reduce unforeseen effects:

- Flush the pump and change the oil: contamination present in the oil can leave deposits and block lubricating parts affecting pump performance and lifetime.
- Replace shaft seals: shutdown may have caused some internal parts to deform. leading to internal leaks.

To ensure proper and safe restarting we recommend that our customer service team accompany you. Our start-up support and assisted plant recommissioning can help prevent serious issues, as nothing is more expensive and time-consuming than a plant with limited functionality.
